

Sprint Review 4

On 26 October 2022, we met Mr. Michael De Dervalho, the customer, for a sprint 4 review meeting. The main focus of this sprint is the polish and the general outlook of the application. Load shading was the main issue we had this sprint and it affected our working capacity but we managed to push through. We managed to implement everything the customer wanted.

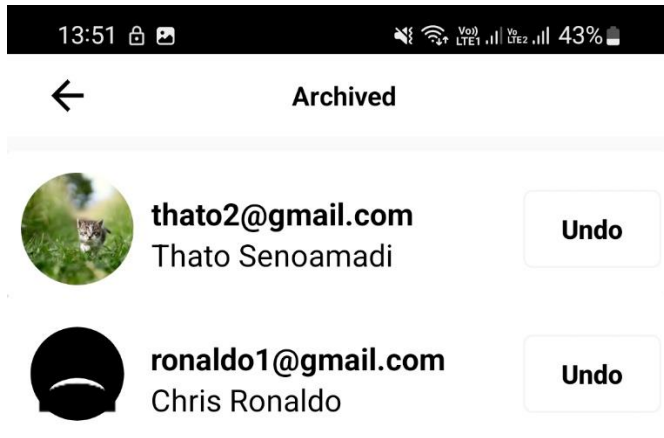

Sending media

What is a social media application if you cannot send pictures, videos, audio and pdf files to you loved ones be it family or friends. In this sprint we managed to implement a feature which allows users to send pictures, videos and audios to one another.

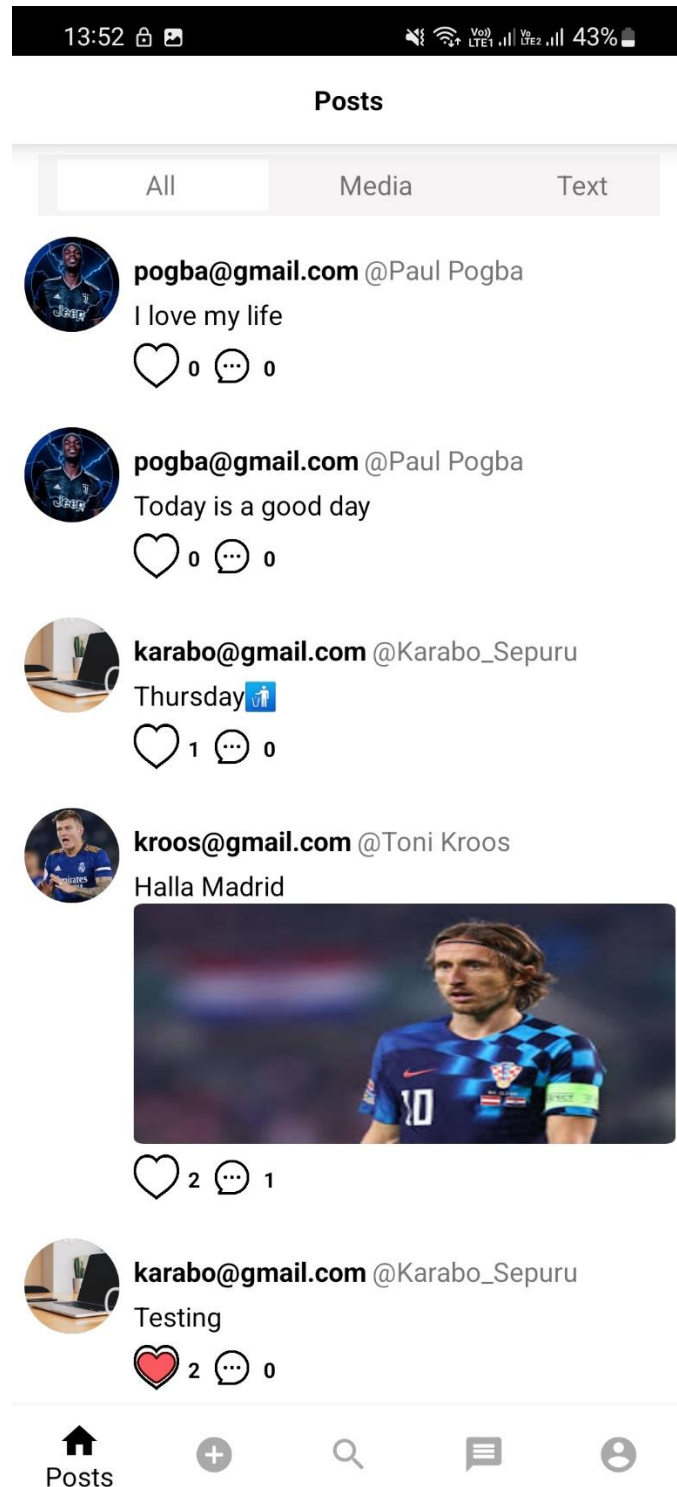

Archiving Chats

We all have chats that we do not want everyone else to see when they open our text message application. This new feature allows users to archive some of their chats. The feature allows for enhanced privacy and security

Posting Text

Why limit the user to post pictures when they can post texts as well. This new feature allows users to posts text. The other users can then comment and like the text post.

Listing chat history

The previous version of the application could only send messages but could see all the people they send messages to. This new version allows the user to see all the people they have messaged in chronological order.
